

27th-30th April 2010, Malaga, Spain

Karst formations cover about an eighth of the Earth's surface and have been studied since time immemorial.. The threshold of the second decade of the 21st century seems a good time to reflect on the progress made in recent times and to set out some of the lines of research to pursue in the near future. This is the aim of this 4th International Symposium on Karst (ISKA-2010) organized by the Centre of Hydrogeology at the University of Málaga and the Spanish Geological Survey (IGME), in the framework of their "Advanced Hydrogeological Studies" partnership.
